

REMARKS

Claims 1-10, 12, 17-31, 36-48, 50, 55-57, 59, 61, 62, 73-82, 93-136, and 145-170 were pending in the present application. By virtue of this response, Claims 1, 20, 39, 59, 61, 62, and 155 have been amended, and new Claims 171-176 have been added. Accordingly, Claims 1-10, 12, 17-31, 36-48, 50, 55-57, 59, 61, 62, 73-82, 93-136, and 145-176 are currently under consideration. Amendment and cancellation of certain claims are not to be construed as a dedication to the public of any of the subject matter of the claims as previously presented.

Claim Rejections under 35 U.S.C. § 112

Claim 155

Claim 155 stands rejected under 35 U.S.C. 112, second paragraph, as allegedly indefinite for purportedly failing to particularly point out and distinctly claim the subject matter which Applicants regard as the invention. More specifically, the Examiner alleged that the conversion step in Claim 1, from which Claim 155 indirectly depends, cannot use the modified calibration set, because the modified calibration set is obtained after the conversion has occurred.

In response, Applicants amend Claim 155 to recite an additional “step of converting sensor data into calibrated data using the modified set.” Accordingly, Applicants respectfully request that the rejection be withdrawn.

Claim Rejections under 35 U.S.C. § 103(a)

Claims 1-10, 12, 17-31, 36-48, 50, 55-57, 59, 61-62, 73-82, 93-113, 116-121, 124-130, 133-147, and 150-170

Claims 1-10, 12, 17-31, 36-48, 50, 55-57, 59, 61-62, 73-82, 93-113, 116-121, 124-130, 133-147, and 150-170 stand rejected under 35 U.S.C. § 103(a) as allegedly unpatentable over U.S. Patent Application Publication No. 2007/0161288 (hereinafter referred to as “Shin”) in view of a published article titled “The MiniMed Continuous Glucose Monitoring System” (hereinafter referred to as “Mastrototaro”), U.S. Patent No. 5,706,807 (hereinafter referred to as “Millar”), and U.S. Patent Application Publication No. 2007/0213610 (hereinafter referred to as “Say”). Applicants respectfully traverse the obviousness rejection. The limitations of the rejected claims are set forth in the listing of claims provided above.

It is well settled that the Examiner “bears the initial burden of presenting a *prima facie* case of unpatentability...” *In re Sullivan*, 498 F.3d 1345 (Fed. Cir. 2007). Until the Examiner has established a *prima facie* case of obviousness, Applicants need not present arguments or evidence of non-obviousness. To establish a *prima facie* case of obviousness, the Examiner must establish at least three elements. First, the prior art reference (or references when combined) must teach or suggest all of the claim limitations: “All words in a claim must be considered in judging the patentability of that claim against the prior art.” *In re Wilson*, 424 F.2d 1382, 165 U.S.P.Q. 494, 496 (CCPA 1970); *see also M.P.E.P. § 2143.03*. Second, there must be a reasonable expectation of success. *In re Merck & Co., Inc.*, 800 F.2d 1091 (Fed. Cir. 1986); *see also M.P.E.P. § 2143.02*. And finally, the Examiner must articulate some reason to modify or combine the cited references that renders the claim obvious. Merely establishing that the claimed elements can be found in the prior art is not sufficient to establish a *prima facie* case of obviousness:

As is clear from cases such as *Adams*, a patent composed of several elements is not proved obvious merely by demonstrating that each of its elements was, independently, known in the prior art. *KSR Int’l Co. v. Teleflex Inc.*, 127 S. Ct. 1727, 1741 (2007) (emphasis added).

Instead, the Court has made clear that the Examiner must establish a reason one of skill in the art would have combined the elements of the prior art, and that such reason must be more than a conclusory statement that it would have been obvious.

Often, it will be necessary for a court to look to interrelated teachings of multiple patents; the effects of demands known to the design community or present in the marketplace; and the background knowledge possessed by a person having ordinary skill in the art, all in order to determine whether there was an apparent reason to combine the known elements in the fashion claimed by the patent at issue. To facilitate review, this analysis should be made explicit. *See In re Kahn*, 441 F.3d 977, 988 (C.A.Fed.2006) (“[R]ejections on obviousness grounds cannot be sustained by mere conclusory statements; instead, there must be some articulated reasoning with some rational underpinning to support the legal conclusion of obviousness”). [Underlining added for emphasis.] *KSR Int’l Co. v. Teleflex Inc.*, 127 S. Ct. 1727, 1740-1741 (2007).

In the last Office Action, the Examiner acknowledged that Shin “does not evaluate the quality of [a] calibration set” and that Mastrototaro only “teaches retrospective calibration, i.e., it calibrates the data after it has been collected.” *See* Office Action dated December 18, 2008, page

3. The Examiner, however, contended that “Millar teaches using the R-value is a real time or prospective calibration” and that it purportedly “would have been obvious to modify the Shin/Mastrototaro combination to evaluate the calibration in real time, as it is merely [the] substitution of one equivalent technique for another.” *Id.*

Applicants respectfully disagree. Contrary to the Examiner’s assertion, the calibration mechanism used by Mastrototaro cannot be arbitrarily modified by replacing Mastrototaro’s retrospective calibration method with Millar’s real-time (*i.e.*, prospective) calibration method, especially when there is no explicit teaching or suggestion to do so. To clarify, Mastrototaro teaches a continuous glucose monitoring system that uses a calibration mechanism, which specifically requires the obtaining of at least three meter-sensor data pairs for each new day and the discarding of meter-sensor data pairs obtained from previous days. By contrast, Millar teaches an apparatus, for determining the amount of components in a pulping liquor, that uses a calibration mechanism, which specifically requires the continuous accumulation of new meter-sensor data pairs that improve the R-value (*i.e.*, correlation) of Millar’s calibration algorithm. In other words, whereas Mastrototaro’s calibration mechanism employs a moving time window, in which meter-sensor data pairs obtained earlier than a 24-hour time period are discarded, Millar’s calibration mechanism does not employ such a window, and as such, meter-sensor data pairs are selectively obtained and retained indefinitely.

Applicants submit that if the Mastrototaro calibration mechanism was modified to replace Mastrototaro’s retrospective calibration method with Millar’s real-time calibration method, as suggested by the Examiner, the proposed modification would render the Mastrototaro calibration mechanism unsatisfactory for its intended purpose. *See In re re Grasselli*, 713 F.2d 731, 743 (Fed. Cir. 1983) (holding that it is improper to combine references where the references teach away from their combination); *see also In re Gordon*, 733 F.2d 900, 902 (Fed. Cir. 1984) (finding no suggestion to modify the prior art device where the modification would render the device inoperable for its intended purpose). For instance, a design problem would arise as to whether the hypothetically modified calibration mechanism would still retain the moving time window employed by the Mastrototaro calibration mechanism. If the moving time window was retained in the hypothetically modified Mastrototaro calibration mechanism, then the modified calibration mechanism would seemingly be incapable of providing reliably accurate prospective

calibration, because the Mastrototaro calibration mechanism uses only those meter-sensor data pairs received for any given day to evaluate calibration, which would appear to include either 0, 1, 2, or 3 meter-sensor data pairs depending on the time of the day (and the number of meter readings received) and thus, during at least some portion of each day, there would not be sufficient meter-sensor data pairs to obtain a meaningful correlation coefficient. (Mastrototaro specifically describes this problem in stating that a warning message would appear if fewer than three meter-sensor data pairs exist for a given day, "because the correlation coefficient in such a case cannot be meaningfully calculated"). By contrast, if the time window was not employed in the modified calibration mechanism, and new meter-sensor data pairs were continuously accumulated without discarding aged meter-sensor data pairs, as taught by Millar, Applicants submit that R-value evaluation would also not provide accurate calibration, because an approach involving adding new meter-sensor data pairs, without a mechanism for discarding at least some meter-sensor data pairs, would expose the calibration mechanism to drift and other potential errors. This is particularly true with biological sensor systems, such as Mastrototaro's system, where inevitable physiological changes (e.g., changes in metabolism, interfering blood constituencies, lifestyle changes) will affect sensor calibration, in contrast to a wood pulping process, as taught in Millar, where process conditions may be controlled and held substantially constant.

Applicants submit that there are no teachings in Mastrototaro nor in Millar that would reasonably lead one of skill in the art to modify Mastrototaro's calibration mechanism to incorporate Millar's real-time calibration method. Furthermore, the Office Action has provided no guidance as to how the teachings of Mastrototaro and Millar can be reasonably combined to successfully construct a calibration mechanism corresponding to the claimed invention, particularly where the calibration mechanisms described in Mastrototaro and Millar appear to be diametrically opposed to each other (*i.e.*, retrospective calibration in Mastrototaro vs. prospective calibration in Millar). For at least these reasons, the obviousness rejection of Claims 1-10, 12, 17-31, 36-48, 50, 55-57, 59, 61-62, 73-82, 93-113, 116-121, 124-130, 133-147, and 150-170 cannot stand. Applicants therefore respectfully request that the rejection be withdrawn.

Claims 114-115, 122-123, 131-132, and 148-149

Application No.: 10/633,329
Filing Date. August 1, 2003

Claims 114-115, 122-123, 131-132, and 148-149 stand rejected under 35 U.S.C. § 103(a) as allegedly unpatentable over Shin in view of Mastrototaro, Millar, and Say, and further in view of an article titled Clinical Performance of CGMS in Type 1 Diabetic Patients Treated by Continuous Subcutaneous Insulin Infusion Using Insulin Analogs (hereinafter referred to as "Guerci"). The limitations of the rejected claims are set forth in the listing of claims provided above, along with the criteria for establishing a *prima facie* case of obviousness and the teachings of Shin, Mastrototaro, Millar, and Say. As discussed above, Shin, Mastrototaro, Millar, and Say in combination do not fairly teach or suggest the invention as recited in Applicants' pending claims. Guerci includes no teaching overcoming the deficiencies of Shin, Mastrototaro, Millar, and Say; Guerci merely teaches that both R wave and Clarke error grid are known ways to evaluate a glucose sensor. Accordingly, Claims 114-115, 122-123, 131-132, and 148-149, which directly depend from independent Claims 1, 20, 39, or 62, are patentable for at least the same reasons that Claims 1, 20, 39, and 62 are patentable. Applicants therefore respectfully request that the rejection be withdrawn.

New Claims

New Claims 171-176 recite evaluating the quality of the calibration set using a statistical or clinical association of at least one matched data pair with one or more clinically-based or physiologically based-criteria. None of the references cited in the Office Action, alone or in combination, teach or fairly suggest this feature. Accordingly, Applicants submit that new Claims 171-176 are allowable for at least this reason, and for at least the same reasons described above with respect to Claims 1, 20, 39, 59, 61, and 62.

Co-Pending Applications of Assignee

Applicants wish to draw the Examiner's attention to the following applications of the present application's assignee.

Conclusion

In view of the above, each of the presently pending claims in this application is believed to be in immediate condition for allowance. Accordingly, the Examiner is respectfully requested to withdraw the outstanding rejections of the claims and pass this application to issue. If it is determined that a telephone conference would expedite the prosecution of the application, the Examiner is invited to telephone the undersigned at the number provided below.

Any remarks in support of patentability of one claim should not be imputed to any claim, even if similar terminology is used. Additionally, any remarks referring to only a portion of a claim should not be understood to base patentability on that portion; rather, patentability must rest on each claim taken as a whole. Applicants respectfully traverse each of the Examiner's rejections and each of the Examiner's assertion regarding what the prior art shows or teaches, even if not expressly discussed herein. Although amendments have been made, no acquiescence or estoppel is or should be implied thereby. Rather, the amendments are made only to expedite prosecution of the present application, and without prejudice to presentation or assertion, in the future, of claims on the subject matter affected thereby.

Although the present communication may include alterations to the application or claims, or characterizations of claim scope or referenced art, Applicants are not conceding in this application that previously pending claims are not patentable over the cited references. Rather, any alterations or characterizations are being made to facilitate expeditious prosecution of this application. Applicants reserve the right to pursue at a later date any previously pending or other broader or narrower claims that capture any subject matter supported by the present disclosure, including subject matter found to be specifically disclaimed herein or by any prior prosecution. Accordingly, reviewers of this or any parent, child, or related prosecution history shall not

Application No.: 10/633,329
Filing Date. August 1, 2003

reasonably infer that Applicants have made any disclaimers or disavowals of any subject matter supported by the present application.

No fee is believed due with the filing of this document. However, in the event the U.S. Patent and Trademark Office determines that an extension and/or other relief is required, Applicants petition for any required relief including extensions of time and authorizes the Commissioner to charge the cost of such petitions and/or other fees due in connection with the filing of this documents to Deposit Account No. 11-1410, of which the undersigned is an authorized signatory.

Respectfully submitted,

KNOBBE, MARTENS, OLSON & BEAR, LLP
